

A Conventional Random Forest

Higher redundancy, weaker tree diversity

B Proposed Random-Subspace RF

More diversity, reduced overfitting, better generalization

Aspect	Conventional RF	Proposed Random-Subspace RF
 Features per split	All p features ($m_{try} = p$)	✓ Random subset ($m_{try} = 0.7p$)
 Tree diversity	Lower (higher redundancy)	✓ Higher (different subsets across trees)
 Generalization	Baseline (more prone to overfitting)	✓ Improved (better robustness and generalization)
